## Summary / Statement

Songshi Dou's research focuses on computer networks, including software-defined networking (SDN), network function virtualization (NFV), data center network (DCN), and content delivery network (CDN). He has published 10 papers and owned/applied 5 Chinese patents.

## Education

<b>Beijing Institute of Technology (BIT)</b> , Beijing, China	2019 - 2022
M.S. in Control Engineering, June 2022	
Advisor: Prof. Zehua Guo	
Dissertation: Maintaining the Path Programmability in Software-Defined Wide Area Networks (Outstanding Master's Thesis of BIT)	
<b>North China Electric Power University (NCEPU)</b> , Beijing, China	2015 - 2019
B.S. in Automation, June 2019	

## Research Experiences

**Path Programmability Recovery in SD-WANs under Multiple Controller Failures**     Sept. 2019 - Jun. 2022

- **[Situation]:** SDN promises good network performance in Wide Area Networks (WANs) with the logically centralized control using physically distributed controllers. In Software-Defined WANs (SD-WANs), the flexible flow control of SDN comes from path programmability. Once a flow traverses an SDN switch, it becomes a programmable flow and is able to change its forwarding path. Under unpredictable issues, the controller may fail, and its controlled switches will be unmanageable and become offline. Thus, maintaining path programmability, which enables flexible path change on flows, is crucial for maintaining network performance under traffic variation.
- **[Action]:** We propose to improve the path programmability in SD-WANs under multiple controller failures.
  - 1) For all circumstances, **Matchmaker** is proposed to adaptively adjust the control cost of offline switches based on the limited control resource by changing the paths of flows to realize proper offline switches remapping.

- 2) If hybrid OpenFlow/OSPF mode is supported, **RetroFlow+** can be used to recover the flow programmability and achieve low communication overhead by intelligently configuring a set of selected offline switches working under the legacy routing mode; **ProgrammabilityMedic** recovers programmability by fine-grainedly selecting a routing mode for each offline flow at each offline switch to fit the given control resource from active controllers.
  - 3) If network slicing techniques (e.g., FlowVisor) are supported, **ProgrammabilityGuardian** is exhibited to recover all offline flows with the similar path programmability with fine-grained flow-level mappings.
- **[Results]:** Four papers have been published (TON'22, ICDCS'21, COMNET'21, IWQoS'20); Two papers are under revision (TON).

### Traffic Engineering in SD-WANs with Scalable Routing

Mar. 2020 - Mar. 2021

- **[Situation]:** The scalability issue hinders the deployment of SDN in the WANs. Existing solutions have two issues: (1) network performance relies on complicated controller synchronization, which increases the complexity of network control; (2) fine-grained flow processing enables flexible flow control at the cost of high processing load on the controllers and high flow table occupancy on switches.
- **[Action]:** We propose **HybridFlow** to achieve good load balancing performance using a single controller with low control overhead, which mainly employs hybrid routing and crucial flow rerouting to reduce the processing load of controller by routing the critical flows (having critical impact on network performance) with the hybrid OpenFlow/OSPF mode.
- **[Results]:** One paper has been published (TCOM'21).

### Multipath-aware and Resource Efficient Rate Limiter Placement in DCNs

Jun. 2021 - Jan. 2022

- **[Situation]:** Emerging cloud services and applications request different Quality of Service (QoS) using shared links in DCNs. To meet these various requirements, programmable switch-based rate limiters are introduced to provide performance isolation and benefit from easy control and fast deployment. However, existing programmable switch-based rate limiters have two limitations: (1) multipath flows (i.e., MultiPath TCP), which are widely used in DCNs, cannot be precisely limited, and (2) the control plane solution for rationally placing rate limiters in DCNs is missing, leading to poor performance isolation.
- **[Action]:** We propose **RateSheriff** to provide multipath flow-aware and resource-efficient rate limiter placement for programmable switch-enabled DCNs, which can identify and associate subflows to a multipath flow by extracting and comparing specific packets and header fields and place rate limiters for single-path flows and multipath flows individually to improve rate limiting performance and balance memory utilization among programmable switches.
- **[Results]:** One paper is under review.

### Reducing Control Latency by Exploring the Impact of Critical Programmability

Apr. 2021 - Aug. 2021

- **[Situation]:** Control latency is a critical concern for deploying SDN into WANs. An SD-WAN can be divided into multiple domains controlled by multiple controllers with a logically centralized view. The control latency is

related to the placement of controllers and mappings between switches and controllers. Existing solutions usually treat switches equally and consider the propagation delay between switches and controllers as the evaluation metric, which fails to consider many important factors of dynamic network states and leads to high control latency in real-world deployment.

- **[Action]:** We propose **ProgrammabilityExplorer** to decide proper controller placement and switch-controller mapping realizing low control latency, which differentiates the impact of switches on the control operation by jointly considering the flow programmability and critical flows.
- **[Results]:** One paper has been published (SocialMeta'22); One paper is under review (TON).

### Video Quality and Popularity-aware Video Caching in CDN

Jun. 2021 - Aug. 2021

- **[Situation]:** CDN is a popular service to accelerate object transmission by dynamically caching popular objects at cache points near users. However, a limited number of cache points are deployed with limited storage space and cannot cache all videos. Existing video caching schemes for CDN fail to consider some important components of Quality of Experience (QoE), leading to poor video caching performance.
- **[Action]:** We introduce a new QoE metric called Video Hit Experience (VHE) that jointly considers the impact of video hit ratio and video quality on QoE, and propose **HERO** to improve QoE with both proactive module and reactive module.
- **[Results]:** One paper has been published (ICWS'21).

## Patents

- [P5] Zehua Guo, Yutian Zhang, Ning Han, and **Songsbi Dou**, “A Traffic Engineering-centric Traffic Matrix Prediction Method”, Chinese Patent, Application Number: 202110810615.0.
- [P4] Zehua Guo, **Songsbi Dou**, and Yuanqing Xia “A Scalable Routing Method for Realizing Load Balancing in Software-Defined Wide Area Networks”, Chinese Patent, ZL202010974299.6.
- [P3] Zehua Guo, and **Songsbi Dou**, “Optimizing Flow Programmability under Multiple Controller Failures in Software-Defined Networks”, Chinese Patent, ZL202010544094.4.

- [P2] Zehua Guo, Penghao Sun, **Songshi Dou**, Yutian Zhang, Ning Han, and Yuanqing Xia, “Deep Reinforcement Learning-based Data Center Network Energy Management and Quality of Service Optimization Method”, Chinese Patent, ZL202010308862.6.
- [P1] Zehua Guo, Penghao Sun, **Songshi Dou**, Yuanqing Xia, and Honghai Ji, “A Load Balancing Method for Multi-Controller in Software-Defined Networking”, Chinese Patent, ZL202010094237.6.

## Honors & Awards

- **Outstanding Master’s Thesis**, Beijing Institute of Technology 2022
- **Outstanding Graduates**, Beijing Institute of Technology 2022
- **National Scholarship Award (Top 1%)**, Chinese Ministry of Education 2021
- **Outstanding Model Master Student (Top 1%)**, Beijing Institute of Technology 2021
- **Outstanding Master Student Scholarship Award**, Beijing Institute of Technology 2021
- **ICNP 2021 Student Registration Award**, IEEE Computer Society 2021
- **OSDI 2021 Student Grant**, USENIX 2021
- **ICDCS 2021 Student Registration Award**, IEEE Computer Society 2021
- **CNCC 2020 Student Registration Award**, China Computer Federation 2020
- **First-class Master Student Scholarship Award**, Beijing Institute of Technology 2020
- **Bachelor Student Scholarship Award**, North China Electric Power University 2016, 2017, 2018

## Talks & Presentations

- “ProgrammabilityMedic: Predictable Path Programmability Recovery under Multiple Controller Failures in SD-WANs”, *IEEE International Conference on Distributed Computing Systems 2021 (ICDCS’21)*, Online, July 2021.
- “Improving the Path Programmability for Software-Defined WANs under Multiple Controller Failures”, *IEEE/ACM International Symposium on Quality of Service 2020 (IWQoS’20)*, Online, June 2020.

## Language

- Native Chinese (Mandarin)
- Fluent English
  - IELTS: 7 (L: 7.5, R: 8.0, W: 6.5, S: 6.0)
  - PTE: 75 (L: 76, R: 70, W: 81, S: 67)
  - GRE: 322 (Verbal: 152, Quant: 170, AW: 3.0)
